Foods & Recipes API

1.0.0 OAS 3.0

A RESTful API for managing recipes, featuring JWT authentication and PostgreSQL integration.

Servers

http://localhost:3000 - Local Development Server

Authorize

default

POST `/api/auth/login` Login to receive an authentication token

Authenticates a user and returns a JWT token required to access protected recipe routes.

Parameters Try it out

No parameters

Request body required application/json

Example Value Schema

```
{
  "username": "admin",
  "password": "password123"
}
```

Responses

Code	Description	Links
200	Login successful. Returns the JWT token.	*No links*

Code	Description	Links
400	Bad request (missing username or password).	*No links*
401	Unauthorized (invalid credentials).	*No links*

GET `/api/recipes`
Retrieve a list of all recipes (only first 50 of them for development and performance purposes).

Fetches all recipes from the PostgreSQL database. This route is public; hence, doesn't require authentication.

Parameters Try it out

No parameters

Responses

Code	Description	Links
200	A JSON array of recipe objects.	*No links*
500	Server error.	*No links*

POST `/api/recipes` Create a new recipe

Adds a new recipe to the database. Requires JWT authentication.

Parameters Try it out

No parameters

Request body required application/json

Example Value Schema

```
{
  "title": "string",
  "category": "string",
  "ingredients": "string",
```

```
  "directions": "string"
}
```

Responses

Code	Description	Links
201	Recipe successfully created.	*No links*
400	Bad request (missing title).	*No links*
401	Unauthorized.	*No links*

PUT `/api/recipes/{id}` Update an existing recipe

Modifies a recipe by its ID. Requires JWT authentication.

Parameters Try it out

Name	Description
id * required `integer` *(path)*	The recipe ID to update id

Request body required application/json

Example Value Schema

```
{
  "title": "string",
  "category": "string",
  "ingredients": "string",
  "directions": "string"
}
```

Responses

Code	Description	Links
200	Recipe successfully updated.	*No links*
401	Unauthorized.	*No links*
404	Recipe not found.	*No links*

DELETE `/api/recipes/{id}` Delete a recipe

Removes a recipe from the database by its ID. Requires JWT authentication.

Parameters

Try it out

Name	Description
id * required `integer` *(path)*	The recipe ID to delete id

Responses

Code	Description	Links
200	Recipe successfully deleted.	*No links*
401	Unauthorized.	*No links*
404	Recipe not found.	*No links*
